

Amendments to the Claims

The following listing of claims will replace all prior versions, and listings, of the claims in this application:

Listing of Claims:

1. (Withdrawn) A single-band type metallic belt for winding between annular V-grooves of a drive pulley and a driven pulley, the metallic belt comprising a metal endless band having at least one layer, and a plurality of metal push blocks engaged and superimposed on the band in a manner enabling sliding in a longitudinal direction of the band

the push block including a body formed by bending a single wire material and subsequently performing pressing so as to have two outer side surfaces defining side contact surfaces that are inclined to respectively make frictional contact with two inner surfaces of the annular V-grooves, a pair of pillars respectively extending along extensions of the two contact surfaces of the body and having an outer surface that is continuous with the side contact surfaces of the body, and a pair of opposed hooks extending inwardly from distal ends of the pillars;

wherein an opening is defined by the pair of hooks, and a band holding surface is formed with a cross-sectional shape of a plurality of arcs arranged in parallel on the body in the opening, with the band inserted in the opening of each push block and held on the band holding surface;

a metal retainer arranged on an outer surface of the band in a manner engageable with the pair of hooks to ensure engagement between the band and the push blocks; and

a ring attached to the outer surface of the retainer to prevent deformation of the retainer, the width of the ring being set to be narrower than the width of the retainer.

2. (Withdrawn) The metallic belt according to claim 1, wherein the inner circumferential length of the ring is set to be 0.5 to 1.0 mm longer than the outer circumferential length of the retainer.

3. (Withdrawn) The metallic belt according to claims 1, wherein the width W_2 of the ring and the width W of the opening of the push block have a relationship satisfying $W_2 \leq W$.

4. (Withdrawn) The metallic belt according to claim 1, wherein the ring has a plate thickness of 0.15 to 0.25 mm.
5. (Withdrawn) The metallic belt according to claim 1, wherein sets of projections and concavities for forcing and ensuring alignment of the push blocks that are adjacent are formed at a total of three locations, two on the hooks and one on the body, with each concavity having a shape similar to the corresponding projection.
6. (Withdrawn) The metallic belt according to claim 1, wherein the side contact surface of the body and the side contact surface of the pillar continuous with the body side contact surface are inclined relative to travel direction of the push block, and a corner located at a front side of the body with respect to the travel direction is formed with an obtuse angle.
7. (Withdrawn) The metallic belt according to claim 1, wherein the side contact surface of the body and the side contact surface of the pillar continuous with the body side contact surface include a step (β) for forming a gap with the inner side surfaces of the annular V-grooves of the pulleys on the front side of the push block with respect to the travel direction.
8. (Withdrawn) The metallic belt according to claim 1, wherein the side contact surface of the body and the side contact surface of the pillar include a plurality of grooves extending parallel to the travel direction of the push block, and the width of the grooves at the front side with respect to the travel direction is wider than the width at the rear side of the grooves in the travel direction.
9. (Withdrawn) A push block for use with a metallic belt wound between annular V-grooves of a drive pulley and a driven pulley, wherein a plurality of the push blocks are for being superimposed with one another along the longitudinal direction of the metallic belt, the push block comprising:
a contact surface for making frictional contact with inner side surfaces of the annular V-grooves of both pulleys, the contact surface including an oil breaking portion for breaking up an

oil film formed on the inner side surfaces of the pulleys, wherein the oil breaking portion is formed by a ridge line defined by a rear surface of the push block and the contact surface, wherein the push block is formed by bending a single wire material and then performing pressing.

10. (Withdrawn) The push block according to claim 9, wherein the push block has a front surface located on the front side with respect to travel direction and a rear surface located on the rear side, wherein the angle formed by the contact surface and the front surface of the push block is an obtuse angle.

11-12. (Canceled)

13. (Currently Amended) A push block for use with a metallic belt wound between annular V-grooves of a drive pulley and a driven pulley, wherein the metallic belt has a metal endless band having at least one layer and a plurality of metal push blocks ~~wherein a plurality of the push blocks are for being engaged and~~ superimposed with one another on the band along the longitudinal direction of the metallic belt, the push block comprising:

a front surface located at a front side of the push block in a travel direction of the push block and a rear surface located at a rear side of the push block in the travel direction;

a side contact surface opposing inner side surfaces of the annular V-grooves of both pulleys, the side contact surface extending between the front and rear contact surfaces, the side contact surface having an associated lengthwise direction and an associated widthwise direction that is transverse to the lengthwise direction, whereby the widthwise direction is generally parallel to ~~[[a]]~~ the travel direction of the push block; and

a front half of the contact surface ~~forms~~ forming an obtuse angle with the front surface of the push block, a rear half of the contact surface ~~forms~~ forming an obtuse angle with the rear surface of the push block, and a ridge line comprising a line formed by an intersection of said front half and said rear half, said ridge line functioning as an oil film breaking portion for breaking an oil film, which forms on the inner side surfaces of the annular V-grooves of the pulleys, and extending along the entire length of the contact surface in substantially the

lengthwise direction and at a middle part of the contact surface in the widthwise direction, wherein the push block is formed by bending a single wire material and then performing pressing.

14. (Withdrawn) A push block for use with a metallic belt wound between annular V-grooves of a drive pulley and a driven pulley, wherein a plurality of the push block are for being superimposed with one another along the longitudinal direction of the metallic belt, the push block comprising:

a side contact surface opposing inner side surfaces of the annular V-grooves of both pulleys; and

a step extends along the entire length of the contact surface on a front portion of the contact surface, wherein the step defines a ridge line functioning as an oil film breaking portion for breaking an oil film, which forms on the inner side surfaces of the annular V-grooves of the pulleys, wherein the push block is formed by bending a single wire material and then performing pressing.

15. (Currently Amended) A push block for use with a metallic belt wound between annular V-grooves of a drive pulley and a driven pulley, wherein the metallic belt has a metal endless band having at least one layer and a plurality of metal push blocks ~~wherein a plurality of the push blocks are for being~~ engaged and superimposed with one another on the band along the longitudinal direction of the metallic belt, the push block comprising:

a front surface located at a front side of the push block in a travel direction of the push block and a rear surface located at a rear side of the push block in the travel direction;

a side contact surface opposing inner side surfaces of the annular V-grooves of both pulleys, the side contact surface extending between the front and rear contact surfaces, the side contact surface having an associated lengthwise direction and an associated widthwise direction that is transverse to the lengthwise direction, whereby the widthwise direction is generally parallel to a travel direction of the push block; and

a front portion of the contact surface forming an obtuse angle with the front surface of the push block, and a groove extending along the entire length of the contact surface in substantially

the lengthwise direction and at the middle of the contact surface in the widthwise direction, wherein an inner wall of the groove and the contact surface defines the ridge line that functions as the oil film breaking portion, which forms on the inner side surfaces of the annular V-grooves of the pulleys, wherein the push block is formed by bending a single wire material and then performing pressing.

16. (Previously Presented) The push block according to claim 15, wherein the groove has a rectangular cross-section.

17. (Previously Presented) The push block according to claim 15, wherein the groove has a triangular cross-section.

18. (Currently Amended) The push block according to claim 15, wherein the side contact surface ~~of the body of the push block in frictional contact with the inner side surfaces of the annular V-grooves of both of the pulleys and the side contact surface of the pillar continuous with the body side contact surface~~ includes a plurality of grooves extending parallel to the travel direction of the push block, with the width of the groove at the front side in the travel direction being wider than the width at the rear side in the travel direction.

19. (Canceled)

20. (Withdrawn) A metallic belt comprising an endless metal band and a plurality of push blocks engaged with the metal band in a relatively movable manner and wound between a drive pulley and a driven pulley so as to enable continuously variable transmission of rotation speed of the driven pulley

a plurality of thin plate-shaped rings having cross-sections of a plurality of continuous arcs, the rings being superimposed to form the metal band;

an endless non-processed retainer, arranged on an outer surface of the metal band, for engaging the metal band and the push block; and

an endless non-processed ring, arranged on an outer surface of the retainer, for preventing

deformation caused by vibration in the superimposing direction of the metal band, the width of the ring being set to be narrower than the width of the retainer;

wherein the retainer and the ring have an arcuate cross-sectional shape similar to the cross-sectional shape of the metal band; and

wherein the push block includes a body having two outer side surfaces defining side contact surfaces that are inclined to respectively make frictional contact with the pulleys, pillars respectively extending along extensions of the two contact surfaces of the body, a pair of opposed hooks formed on distal ends of the pillars, an opening for insertion of the metal band, and a band holding surface defined on an upper surface of the body and shaped to have a cross-sectional shape that is substantially similar to the cross-sectional shape of the band.

21-22. (Canceled)

23. (Withdrawn) A metallic belt according to claim 20, wherein each push block is made of a metal wire material.

24. (Withdrawn) The metallic belt according to claim 20, wherein each push block is made of a steel plate.

25. (Canceled)

26. (Withdrawn) The metallic belt according to claim 20, wherein the retainer and ring have the same cross-sectional shape and the same function.
